

Convolutional neural networks in classification of multi-photon coincidences in J-PET scanner

Sunday, 10 October 2021 15:40 (20 minutes)

Paweł Konieczka, on behalf of the J-PET collaboration

Convolutional Neural Networks are excellent at analyzing images by learning abstract representations. CNN has been an overwhelming strategy in computer vision tasks and has achieved expert-level performances in various fields. There has been a surge of interest in the potential of CNN among radiology researchers and several studies have already been published in areas such as classification [1] and image reconstruction [2].

First general methodology to transform a non-image data into an image for CNN architectures has been presented in [3]. Nevertheless, this method cannot be applied to large data sets, where number of features is very small, because of computational complexity of PCA. The introduction of scheme of non-image data transformation into 2-dimensional matrices will be proposed [4].

The goal of this poster is to present results of multi-photon coincidences classification in J-PET scanner using CNNs. Bayesian optimization of two convolutional network architectures (DeepInsight [3], YOLOv1 [5]) will be presented.
